7 Claude Code habits that kill repetitive work

The basics I use every day while building client systems.

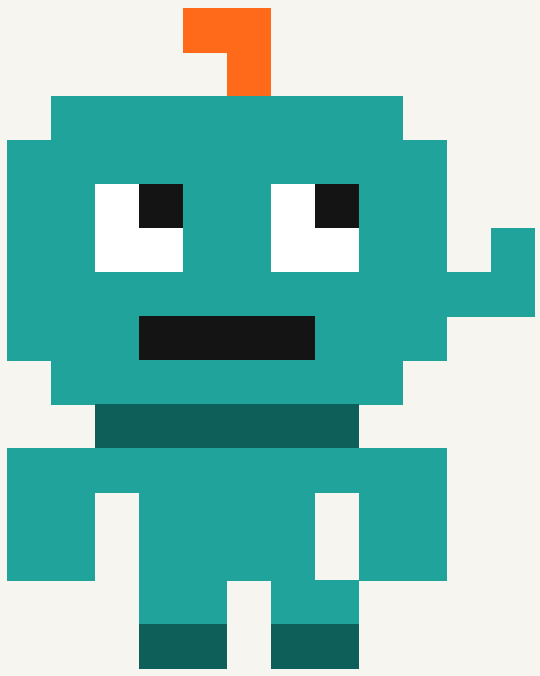

1. CLAUDE.md

A file in your repo that tells Claude your stack, rules and commands. Write it once and every session starts with the right context.

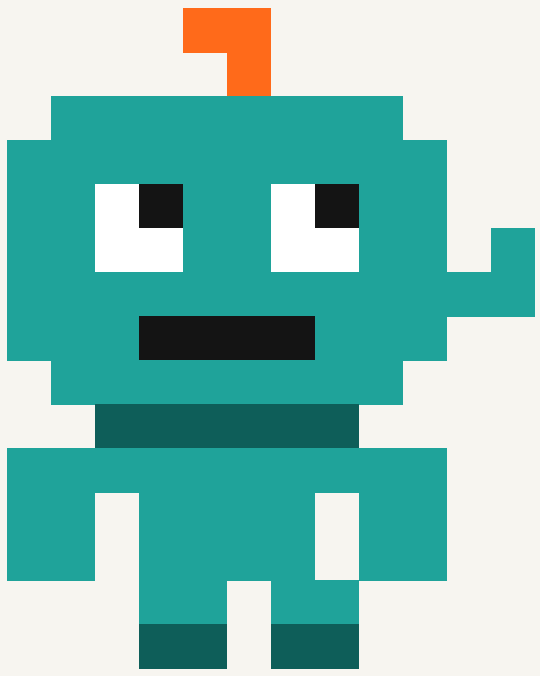

2. Plan first

Ask for a plan before any code. You catch the wrong approach in 30 seconds instead of after 300 lines.

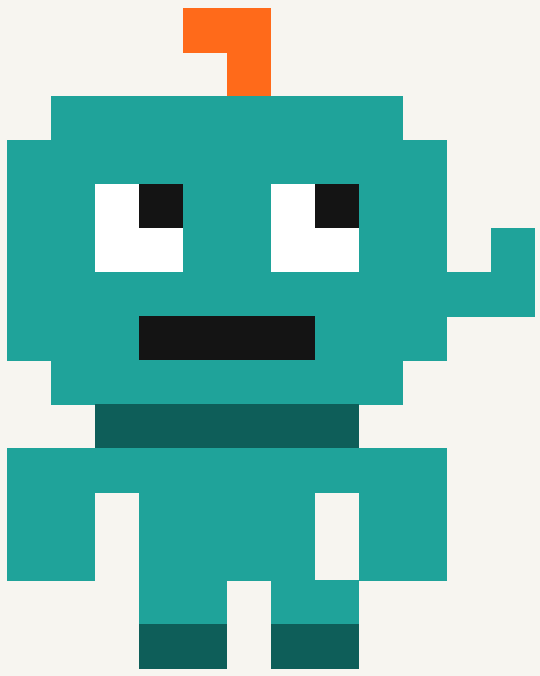

3. Slash commands

Save a prompt you repeat (review this diff, write the tests) as a custom command and run it with one line.

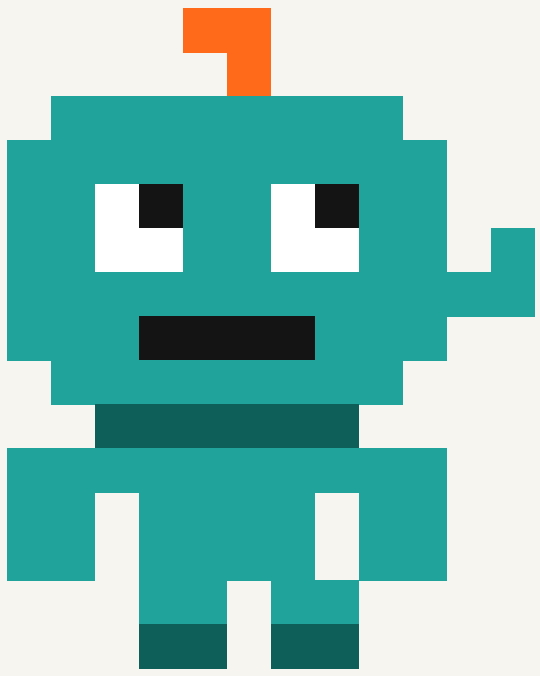

4. Skills

Package a whole workflow (your report format, your deploy steps) as a skill. Claude loads it only when the task needs it.

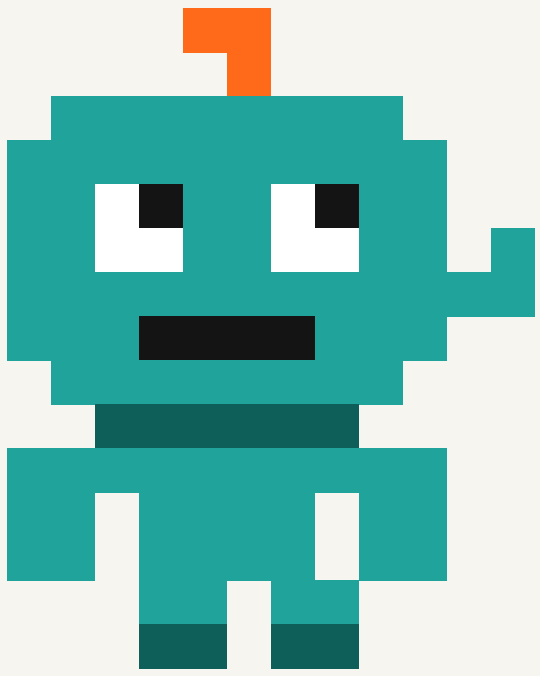

5. Hooks

Run a script automatically on events, like formatting files after every edit, so you never ask for it again.

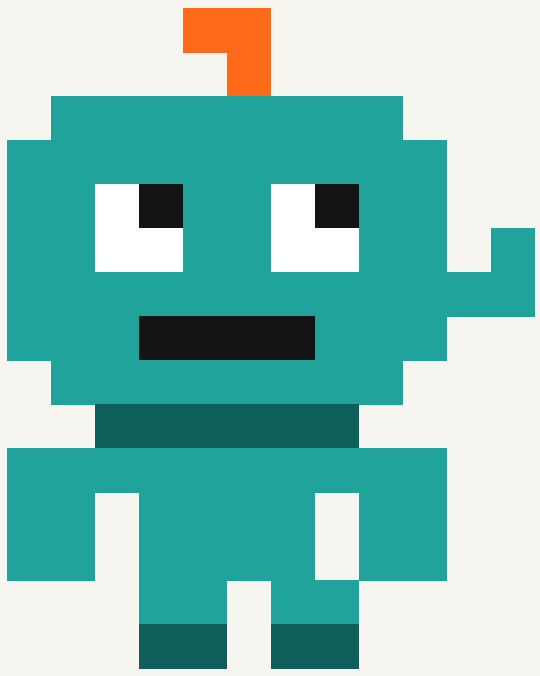

6. Subagents

Hand a big search or review to a separate agent so your main session stays clean and focused.

7. MCP servers

Connect Claude to GitHub, your database or your docs so it can look things up instead of guessing.

Want my CLAUDE.md template?

Comment CLAUDE and I'll DM you the template and setup guide.
