Claude + VAPI + WhatsApp = 24/7 Receptionist

Stop missing calls at 11 PM. This is how to build an agent that answers, qualifies, and books appointments automatically.

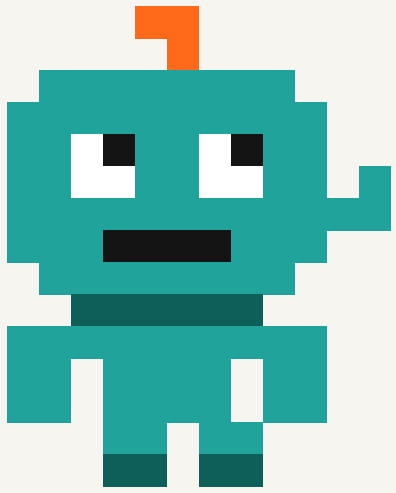

The 3-Layer Architecture

01 VAPI handles real-time voice I/O

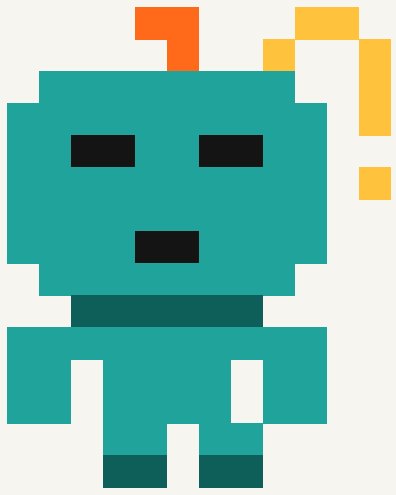

02 Claude processes intent and logic

03 WhatsApp syncs the final booking

VAPI | Claude | WhatsApp

Why This Stack Works

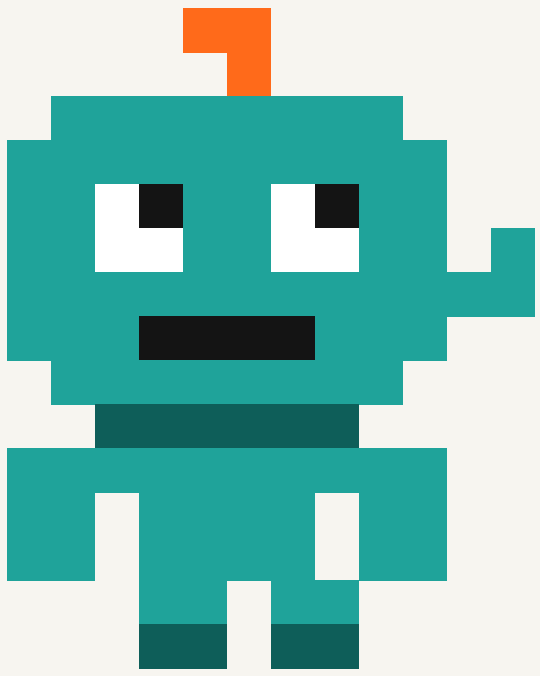

The *Logic* Flow

```text
Call In -> VAPI (STT) -> Claude (Intent) -> API (Book)
-> VAPI (TTS)
```

The agent must confirm the slot before ending the call to prevent double-booking.

"If it breaks, it's usually the latency."

Voice agents feel 'dumb' if there is a pause. Keep your logic chain short and your API calls fast.

Build Your Own Agent

Comment VOICE and I will DM you the full architecture guide.
