MCP explained like you're 15

And the free servers I'd connect to Claude first.

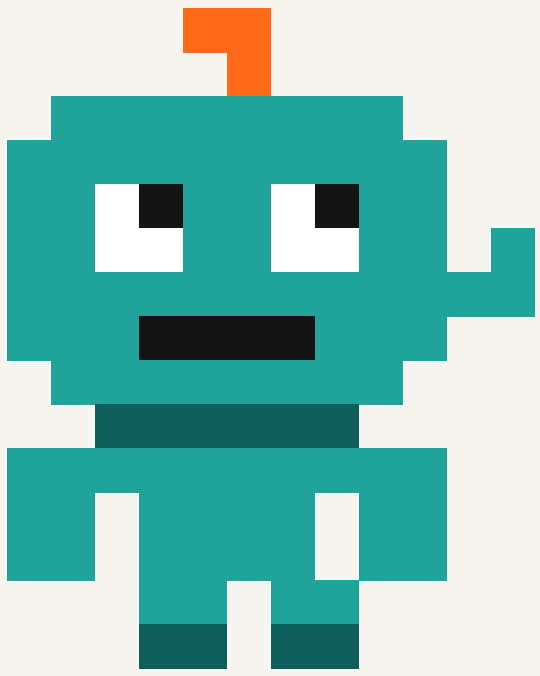

What is MCP?

Model Context Protocol is a standard plug. Instead of writing a new integration for every tool, you run a small server and Claude can use that tool safely.

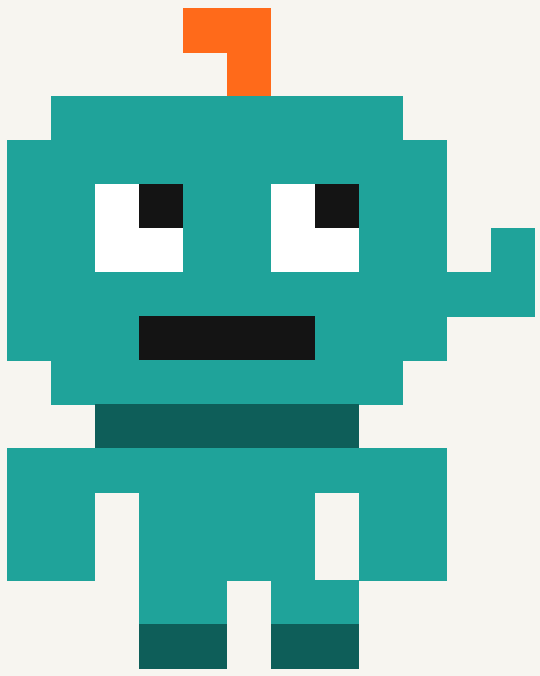

1. Filesystem

Lets Claude read and write files in folders you allow. The simplest one to try first.

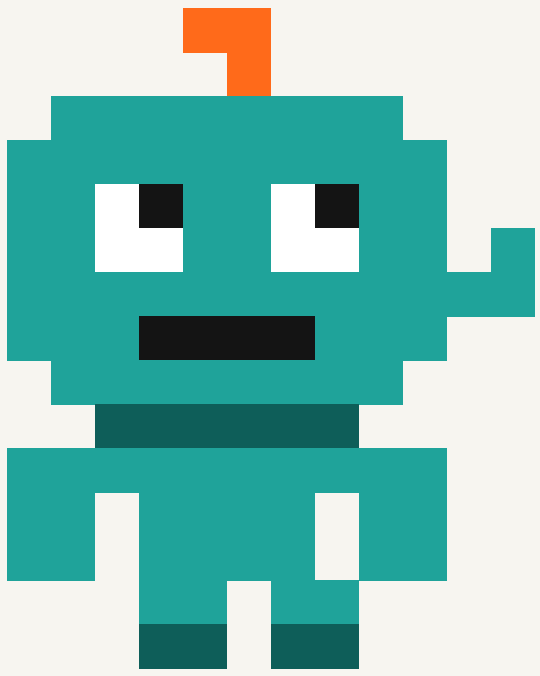

2. Git / GitHub

Claude can read issues, look at code history and open pull requests without you copy-pasting.

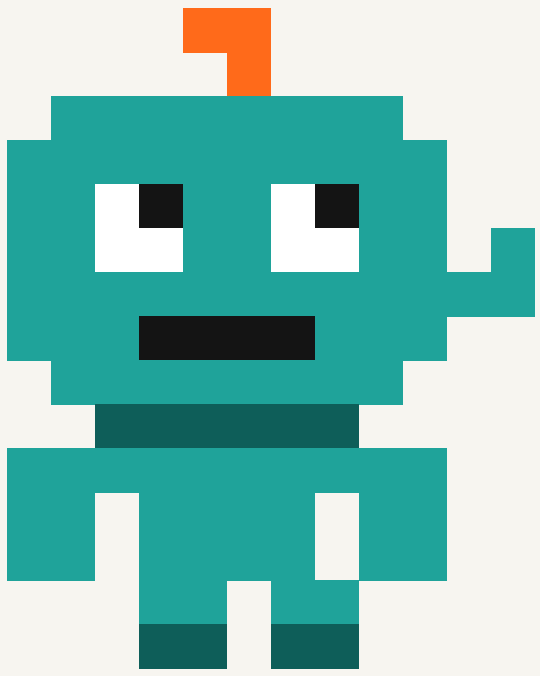

3. Fetch

Pulls a web page and turns it into clean text Claude can work with.

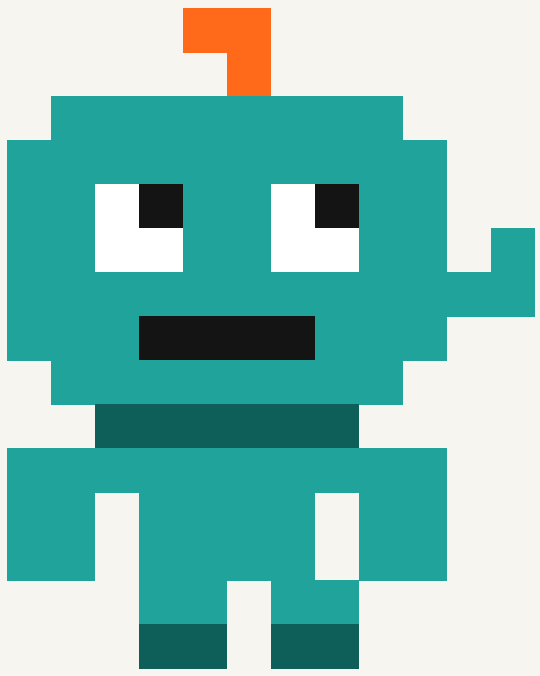

4. Database

Point it at Postgres or SQLite and ask questions about your data in plain English. Start read-only.

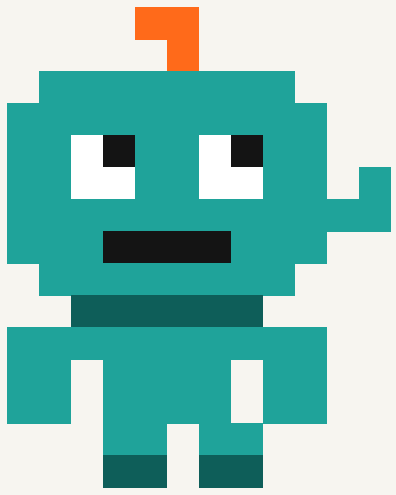

5. Memory

Gives Claude a small notebook it keeps between sessions, useful for long projects.

Safety rules

Want the install steps?

Comment MCP and I'll DM you the setup guide.
